Abstract: A series of Schiff base and their derivative (oxazepine) have been synthesized 1,4-Bis (3-aminopropyl)-piperazine was condensed with various aromatic aldehyde in ethanol in the presence of acetic acid as catalyst to yield the Schiff base(1-8). These Schiff’s bases on treatment with phthalic anhydride gave substituted oxazepine(9-16). The structure of synthesized has been established on the basis of their spectral (FT-IR, Mass,¹H,¹³C-NMR,elemental analysis) data. The purity of the compounds was confirmed by TLC. All these compounds were evaluated for their In vitro activity against several microbes .these compounds were tested to determine their ability to inhibit corrosion of mild steel in 1 mol.l⁻¹ H₂SO₄ .

Key words: Schiff bases, oxazepine ,antibacterial activity, anticorrosion,mild steel.

Introduction

The development of simple synthesis route to widely used organic compounds ring, using readily available reagents is one of the main objective of organic synthesis, Nitrogen heterocycles are of a special interest because they constitute an important class of natural and non natural products, many of which exhibit useful biological activities, one–pot efficient synthesis of heterocyclic derivatives, may permit the development of novel therapies for the treatment of epilepsy, pain and other neurodegen disorder¹.

Some Schiff bases bearing aryl groups², or heterocyclic residues possess excellent biological activities³, which has attracted many researcher’s attention in recent year. They have been reported to used as analgesic, anthelmintic, antituberucler, plant growth regulator, antiviral, antifungal and anticancer⁴. Oxazepine (benzodiazepine) derivative introduced in 1965 for use in relief of the psychoneurosces characterized by anxiety and tension, oxazepam is non-homologous seven membered ring that contains two hetero atoms (oxygen and nitrogen)⁵. Oxazepine compounds have medical and biological important and they have medicinal and pharmaceutical application Among the wide Chemical derivatives are a heteropolymer which have activity And
effectiveness against cancer they also have effective against fungi and bacteria, found that some Oxazepine derivative is considered a medical drug against the disease and also that (dibenzoxazepine) mental depression as in derivative Is a cyclic compound contains a heterogeneous (Amoxapine) compound, Oxazepine derivatives are found to be effective against anxiety and Associated with schizophrenia also found that 7-hydroxyamoxapine) is a pharmaceutical) composite affecting the nervous center (CNS). A send.in (as example) is an antidepressant with a mild sedative component to its action in animals(omoxazepine) reduced the uptake of noradrenalin and serotonin and blocked the responsg of dopamine receptors to dopamine. These interesting biological activities attracted our attention to the chemistry of nitrogen heterocycles(Some oxazepine derivatives act as inhibitors of some enzymes action.

Several Schiff bases have recently been investigated as corrosion inhibitors for various metals and alloys in acid media These substance generally becom effective by adsorption on the metal surface. The adsorbed species protect the metal from the aggressuve medium, which causes decomposition of the metal but also on the chemical structure of the inhibitor.

In this work the inhibiting action of Schiff bases and their derivative on the corrosion steel in 1M H_2SO_4 solution has been investigated. The electro chemical techniques such as polarization measurements were used in this study. Differences in behavior of inhibitors were explained based on structural properties of investigated inhibitors.

Material and Methods

1-General Procedures:

Melting points were determined in open glass capillaries on agallenkamp apparatus and are uncorrected. TLC was performed to assess the reactions and the purity of the products. IR spectra were recorded in KBr (pellet forms) on aNicolet-Avatar-330 FT-IR spectrophometer and note wothy absorption values (cm\(^{-1}\)) alone are listed. \(^1\)H and \(^{13}\)C NMR Spectra were recorded at 400 MHz Bruker AMX using CDCl_3 as solvent. The ESI+ve MS spectra were recorded on a Bruker Daltonics LC-MS Spectrometer. Satisfactory microanalysis was obtained on carlo Erba 1106 CHN analyzer. potantiostat – galvanostat from Amel instruments where used for corrosion activity.

Chemical and starting materials

5-bromosalicylaldehyde, anthracene-9-carbaldehyde, 3-hydroxybenzaldehyde, 4-hydroxybenzaldehyde, O-vanilin, 4-chlorobenzaldehyde, 4-methylbenzaldehyde, 4-(dimethylamino)benzaldehyde and N,N\(^{-}\)bis(3-aminopropyl) piperazine (all from Aldrich) were used as supplied, without further purification.

2-General procedure for synthesis of Schiff base and its derivatives:

I. Preparation of Schiff bases (1-8)

A series of Schiff bases were prepared from the reaction of 1,4-Bis (3-aminopropyl)-piperazine (1 mole), with different aldehydes (2 moles), in 20ml ethanol absolute and few drops of glacial acetic acid. This mixture was refluxed for 2hrs. The mixture was cooled; Precepite was obtained then recrystallized from dioxane.

II. Preparation of Oxazepine( 9-16)

A mixture of Schiff base (0.0012mole) and phthalic anhydride (0.0025mole) was dissolved in (20mL) dry benzene. The mixture was heated for 5hrs in water bath at (70\(^{\circ}\)C), excess solvent was distilled, the precepite was filtered and recyrstallized from ethanol.
3. Biological Activity:

All newly synthesized compounds were tested for their in vitro growth inhibitory activity against a standard strain of pathogenic microorganism including Gram-positive bacteria (Staphylococcus aureus), Gram-negative bacteria (Escherichia coli, Bacillus) Antibacterial activity was done by the disk diffusion method. S. aureus and E. coli were sub cultured in BHI medium and incubated for 18h at 37°C, and then the bacterial cells were suspended according to the McFarland protocol in saline solution to produce a suspended of about 10⁵ CFU ml⁻¹. 10 µl of this suspension was mixed with 10 ml of sterile antibiotic agar at 40°C and poured onto an agar plate in a laminar flow cabinet. Five paper disks (6.0mm diameter) were fixed onto nutrient agar plate. 1 mg of each test compound was dissolved in 100 µl DMSO to prepare stock solution from stock solution different concentration 100, 250, 500, 1000 ppm of each test compound were prepared. These compounds of different concentration were poured over disk plate on to it. Streptomycin was used as standard drug (positive control) DMSO poured disk was determined by the formation of a inhibitory zone after 24h of incubation at 36°C. (Table 1) reports the inhibitory zones (mm) of each compound and the controls²⁰.

4. Anticorrosion Activity:

4.1. Electrochemical measurements: Were carried out in conventional three-electrode system in CHI 604 instrument (USA) at 303 K. The working electrode (mild steel) has a geometric area of 1 cm². The saturated calomel and platinum electrodes were used as reference and auxiliary electrodes. Equation (1) show the calculation of IE from corrosion current :²¹-²⁴

\[
IE = \left(1 - \frac{i_{corr}}{i_{corr}}\right) \times 10^6
\]

(1)

5. Results and Discussion:

5.1. Chemistry and characterization:

The present work involved two steps

First step: include preparation of new eight Schiff bases (1-8) were prepared by reaction of 1,4 bis (3-aminopropyl)-piperazine with different aldehyds. The synthesis of these compounds was carried out lined in Scheme (1) and the physical properties for Schiff base (1-6) including melting point range of (100-170)°C and % yield were range of (70-80)°C and these compounds were identified by FT-IR Spectroscopy, LC-MS, ¹H, ¹³C-NMR. FT-IR spectrum of compounds (1-6) showed characteristic absorption bands (1635) cm⁻¹, (3140) cm⁻¹, (2885-2997) cm⁻¹ due to v(C=N), v(C-H) aromatic, v(C-H) aliphatic respectively. as shown in table (3)²⁵,²⁶ ¹H-NMR spectrum of compound (7) showed multiplet signals at (6.79-7.31)ppm due to aromatic protons and singlet signal at (8.20)ppm due to (C-H) group and singlet signal at 13.49 ppm due to (OH) group in addition to multiplet signals at (1.81) due to (C-H(9) and multiplet signals at (2.33-2.40)ppm due to (C-H(11), (C-H(10) and triplet signal at ((3.58) ppm due to (C-H(8) ¹H-NMR of compound (8) show multiplet signals at (7.39, 7.91, 8.55 ppm) due to aromatic protons of anthracene

Second step: The second step included preparation of new eight Oxazepine (9-16) were prepared by reaction of Schiff bases (1-8) in (First step) with phthalic anhydride in dry benzene The synthesis of these compounds was carried out lined in scheme (1) and the physical properties for oxazepine (9-16) including melting point range of (150-186)°C and % yield were range of (70-80)°C and these compounds were identified by FT-IR, LC-MS and ¹H, ¹³C-NMR. FT-IR spectrum of compounds (9-16) showed clear absorption bands at (1634.38) cm⁻¹ and (1709.59) cm⁻¹ attributed to the v(C=O) Of lactone and lactam inside oxazepine ring. The ¹HNMR spectrum of compound (9-16) showed multiplet signals at (7.69-7.31) ppm due to aromatic protons and singlet signal at (8.02) ppm due to (C-H) group and singlet signal at 13.49 ppm due to (OH) group in addition to multiplet signals at (1.81) due to (C-H(9) and multiplet signals at (2.33-2.40)ppm due to (C-H(11), (C-H(10) and triplet signal at (3.58) ppm due to (C-H(8) ¹H-NMR of compound (8) show multiplet signals at (7.39, 7.91, 8.55 ppm) due to aromatic protons of anthracene

5.2 Antimicrobial activity:

The newly synthesized compounds were screened for their antibacterial activity against *Escherichia coli*, *staphylococcus aureus*, *Salmonella typhi*, *Klebsiella pneumonia*. The results of such studies are given in Table 5. The above data showed that compound (12-16) exhibited very good activity against *E.coli*, *S.aureus*, *Salmonella typhi*. The remaining compounds were found to have good activity against *E.coli* and *Salmonella typhi* slight or moderate activity against *S.aureus* and *Klebsiella pneumonia*.

5.3. Polarisation measurements:

Table 6 shows the corrosion Potential (*Ecorr*), corrosion current (*icorr*) and Tafel slopes (*ba* and *bc*) values of mild steel in 1 mol.L\(^{-1}\)H\(_2\)SO\(_4\) Solution in the absence and presence of inhibitor of all the eight compounds at 303K calculated from Scheme(2-9). From Table 6 it is clear that compound 10,14,16 offers maximum inhibition efficiency among the eight compounds Schiff base derivatives and the studied compounds suppress the anodic reaction to greater extent than the cathodic one. This behaviour is typical of mixed type inhibitors with anodic predominance.

The difference in the efficiency is referred to the molecular structure effect, Which have \(\pi\)-delocalized system of Schiff bases derivatives(C=O) and unshared paris of electrons of N and O atoms that may cause the increasing or decreasing of the electron density on center of adsorption and leading to an easier electron transfer.
from the functional group (C=O-group) to the metal, producing greater coordinate bonding and hence different adsorption and inhibition efficiency.

**Mechanism of corrosion inhibition by Schiff base derivatives:**

The transition of metal/solution interface from a state of active dissolution to the passive state is attributed to the adsorption of the inhibitor molecules and the metal surface, forming a protective film. The rate of adsorption is usually rapid and hence, the reactive metal surface is shielded from the aggressive environment. Adsorption process can occur by electrostatic forces between ionic charges or dipoles of the adsorbed species (electrostatic attraction between the positively charged protonated nitrogen atom and negatively charged mild steel surface, cathodic sites) and the electric charge on the metal surface can be expressed by its potential with respect to the zero charge potential. Also, the inhibitor molecules can be adsorbed species to the vacant electron orbital of low energy in the metal to form a coordinate type of link. Adsorption of inhibitor molecules is often a displacement reaction involving removal of adsorbed water molecules is often a displacement reaction involving removal of adsorbed water molecules from the metal surface.

6. Conclusions

The main aim of the present study is to synthesize and investigate the antimicrobial and anti corrosion activity of new heterocyclic derivatives containing oxazepine ring with the hope of discovering new structures serving as potential broad spectrum antimicrobial agents and anti corrosion agents. The antibacterial revealed that nature of substituents on the phenyl ring viz., methyl, methoxy, hydroxyl, dimethylamino, chloro, bromo and hydroxyl group at the para positions of the aryl moieties are determinant for the nature and extent of the anti-bacterial activity of the synthesized compounds, which might have influences on their inhibiting mechanism of actions. Compound (13-16) which contain electron donating functional moiety is most potent against bacterial. It showed good antimicrobial activity. From the results it is obvious that all eight studied compounds function as effective corrosion inhibitors in 1 mol.L⁻¹H₂SO₄ medium with compounds 10, 14, 16 being the best of eight compounds.
