Anti-inflammatory, Antioxidant, Antibacterial effect and Phytochemical Analysis of *Mucuna pruriens* seed extract

S. Venkatkumar and S. Rajeshkumar*

School of Bio-Sciences and Technology, VIT University, Vellore, TN, India

**Abstract:** The ethanol extracts of seeds of the medicinal plant *Mucuna pruriens* was screened their phytochemical characters for their antimicrobial, antioxidant and anti-inflammatory activities. GC-MS analysis revealed that the presence of 6 compounds at the retention time with minor peaks. These peaks were corresponds to Ethane, 1, 2, 2- trichloro-1,1-difluoro-, Hexadecanoic acid, Ethyl ester, N,N-Dimethyl-2-Cyclohexyloxyethylamine, Cyclotrisiloxane-E, Hexamethyl, Trimethyl[4-(2-Methyl-4-oxo-2-Pentyl)Phenoxy]Silane, Silicic acid, Diethyl bis(trimethylsilyl) ester. The ethanol extract was found to possess the highest antimicrobial activity against harmful pathogenic microorganisms. The scavenging activity of the extract against DPPH, Nitric oxide and hydroxyl free radicals revealed excellent potential comparable to that standard. Ethanolic seed extract showed significant anti-inflammatory activity and the inhibition percentage against protein denaturation and proteinase action is 73% and 64% respectively and the concentration is 300 µg/ml.

**Keywords:** *Mucuna pruriens*; Antibacterial; antioxidant; free radical scavenging; GC-MS analysis.

**Introduction**

Medicinal plants have high amount and variety of phytochemicals like flavonoids, alkaloids, polyphenolsetc. This served as a rich source of therapeutic agents. Medicinal plants are the basis for production of synthetic drug. The natural herbal products highly consumed to treat variable harmful diseases are attracting great interest to discover and develop a new drug. In recent years, plants products are used in alternative therapies and a small kind of research has been properly examined phytochemically in terms of their pharmacological properties.

The plant *Mucuna pruriens* is tropical legume, belongs to the genus *Mucuna* of which consists of 100 species of climbing vines and shrubs mostly distributed in the tropical areas especially in tropical Africa, India and the Caribbean. The genus *Mucuna* belongs to the family Leguminosae and is commonly known as velvet bean or cowitch. Seeds are 12 mm long, ovoid and its colour is shiny black or brown. This plant is enormously consumed by pharmaceutical industries due the presence of high content of L-3,4- dihydroxy phenyl alanine (L-DOPA) in the Mucuna seeds. It is an unusual non protein amino acid. This protein is used to treatment of Parkinsonism disease. The other chemical compounds such as, mucunain, glutathione lecithin, gallic acid, β-sitosterol and serotonin. Commonly, the mature seed contains about 3.1 to 6.1% L-DOPA, with trace amounts of 5-hydroxy tryptamine (serotonin), nicotine, dimethyl tryptamine (DMT), bufotenine, 5-MeO-DMT and beta-carboline. It is used against a wide range of disorders, such as urinary tract, neurological and menstruation disorders, constipation, edema, fever, tuberculosis, ulcers, PD and helminthiases like elephantiasis. The seeds of *M. pruriens* have many pharmacological activity including astringent, laxative,
astringent, laxative, anthelmintic, aphrodisiac, alysepharmic and tonic \(^{14,15}\). Several studies also showed that seed possesses powerful antimicrobial activities \(^{16}\).

Ethyl acetate and methanol extract of \(M.\ pruriens\) exhibited high antioxidant and free radical scavenging activity due to the presence of large amount of phenolics compounds \(^{17,18}\). The aqueous extract of the seeds of \(M.\ pruriens\) exhibited hypoglycemic activity \(^{19}\) and anti-venom activity \(^{20,21,22}\). The aim of this investigation is to prepare and identify the phytochemicals present in the Ethanolic extract of \(M.\ pruriens\) seeds using GC-MS analysis. Finally analyse the therapeutic applications are antimicrobial, anti-inflammatory and in-vitro antioxidant activities of \(M.\ pruriens\) seeds.

Materials And Methods

Collection and Drying of plant materials

The dried seeds of \(Mucuna pruriens\) were collected from Chennai in Tamil Nadu. The seeds were washed thoroughly three times with water and once with distilled water. The plant materials were air dried and powdered. The powdered samples were hermetically sealed in separate polythene bags until the time of extraction.

Preparation of plant extract

About 5 g of powdered seeds were extracted successively with 100 ml of ethanol at 40-50°C in Soxhlet extractor until the extract was clear. The extracts were evaporated to dryness and the resulting pasty form extracts were stored in a refrigerator at 4°C for future use. Compound identification was examined by using GC-MS analysis by comparing the retention times with those of authentic compounds and the spectral data obtained from library data of the corresponding compounds.

Antibacterial activity of Plant Extract

The antibacterial activity of ethanol extracts of \(Mucuna pruriens\) seeds were performed by agar well diffusion method against pathogenic bacteria, \(Streptococcus sp\), \(Klebsiella planticola\), \(Klebsiella pneumoniae\) and \(Staphylococcus aureus\). The inoculums were spread on the Muller Hinton agar medium and 5 wells with 6 mm diameter were made. Then different concentration of (20, 40, 60, 80, 100 µL) purified seed extracts of \(Mucuna pruriens\) leaf extract were added and commercial antibiotic discs are maintained as control. Plates were incubated for 24 hours at 37°C. After incubation the results of plates were examined and recorded, as the presence or absence of zone around the well. This experiment was repeated for three times.

Non enzymatic antioxidant assay (Free radical scavenging assay)

DPPH radical assay

Typically, different concentration (10-50µg/ml) of seed extract was mixed with 1ml of 0.1mMDPPH in methanol solution and 450µl of 50mM Tris-HCl buffer (pH 7.4) and incubated for 30 min and inhibition was measured absorb an ceat517nm. BHT was used as a control \(^{23}\). The percentage of inhibition was calculated from the following quation:

\[
\%\text{Inhibition} = \frac{C_{\text{abs}} - T_{\text{abs}}}{C_{\text{abs}}} \times 100
\]

Nitriz oxideradical inhibition assay

Nitriz oxideradical inhibition activity of plant extract can be estimated by the use of GriessIllosvoy reaction. The reaction mixture prepared by mixing sodium nitroprusside (10mM, 2ml), phosphate buffer saline (0.5ml) and \(Mucuna pruriens\) seed extract (10-50µg/ml) or standard solution (rutin, 0.5 ml). This reaction mixture was incubated at 25°C for 150 min and 0.5 ml of there action mixture was mixed with 1ml of sulfanilic acid reagent (0.33% in 20% glacialacetic acid), then stand up for 5 min for completing diazotisation. Then, 1ml of naphthylethylenediamin edihydrochloride was added, mixed and allowed to stand for 30 min at 25°C. The absorbance of these pink color solutions was measured at 540nm against the corresponding blank solutions.
\%Inhibition=[C_{abs}−T_{abs}/C_{abs}] \times 100

**Hydroxyl Radical scavenging assay**

To this typical assay, 100µl of 28 m M2-deoxy-2-ribose, 500µl solution of various concentrations of the *Mucuna pruriens* (10µ50µg/ml), 200µl of 200µMFeCl₃ and 1.04µMEDTA(1:1v/v),100µH₂O₂ (1.0mM)and100µl as corbic acid (1.0mM) and incubated for 1 hour at 37°C. After incubation, the absorbance of reaction mixture was measured at 532nm against the blanksolution. Vitamin E was used as a positive control.

\%Inhibition=[C_{abs}−T_{abs}/C_{abs}] \times 100

**Anti-inflammatory activity of Amazing bean**

**Inhibition of albumin denaturation**

The inhibitory activity of ethanolic seed extract was determined according to Mizushima et al and Sakatet al. 24, 25. Typically, different concentrations of extract were mixed with 1% bovine albumin fraction and were incubated at 37 °C for 20 min. After incubation the reaction mixture was heated at 51 °C for 20 min then allow cooling. After cooling, the absorbance of the reaction mixture was measured at 660 nm. The experiment was performed in triplicate. The inhibition percentage of protein denaturation was calculated as follows:

\% inhibition = (Control_{Abs}−Sample_{Abs}) \times 100/Control_{Abs}

**Inhibition of haemolysis**

The inhibition of haemolysis was evaluated by following the method 26. To this analysis, 1 ml of different concentration of seed extract (50-300 µg/ml) was mixed with 1 ml of 10% RBCs suspension, saline solution instead of extract was added to the control. Aspirin was used as a standard drug. The reaction mixtures were centrifuged and incubated at 56 °C for 30 min in a water bath, then cool the solution. After cooling the reaction mixtures were centrifuged at 2500 rpm for 5 min and the absorbance of the supernatants was measured at 560 nm. The Percentage inhibition of Haemolysis was calculated as follows:

\% inhibition = (Control_{Abs}−Sample_{Abs}) \times 100/Control_{Abs}

**Results and Discussion**

**GC-MS Analysis of ethanolic *Mucuna pruriens* seeds extract**

The presence of phytochemical constituents in the *M. pruriens* seed extracts which is responsible for the antimicrobial, antioxidant and anti-inflammatory activity was analyzed by using GC-MS. Figure 1 shows the phytochemical screening results showed 6 retention peaks. The retention time and molecular weight of the active compounds present in the *M. pruriens* seed extract was tabulated (Table 1). The prevailing compounds are Ethane, 1, 2, 2'-trichloro-1,1-difluoro-, Hexadecanoic acid, Ethyl ester, N,N-Dimethyl-2-Cyclohexyloxyethylamine, Cyclotrisiloxan E, Hexamethyl, Trimethyl[4-(2-Methyl-4-oxo-2-Pentyl)Phenoxy] Silane, Silicic acid, Diethyl bis(trimethylsilyl) ester. Hexadecanoic acid and ethyl ester are well known antioxidant compound. However, these compounds may responsible for biological activities.

**Antimicrobial activity of Plant leaves**

The antibacterial activity of ethanolic *Mucuna pruriens* seeds extract was evaluated against pathogenic bacteria. The inhibitory zone around the well indicated absence of bacterial growth and the diameters of the zones were measured and recorded (Figure 2-5). The activity of ethanolic seed extract was compared with that of standard antibiotic tetracycline. The result shows the minimum inhibitory concentration (MIC) of seed extract against *Streptococcus sp*, *Klebsiella planticola*, *Klebsiella pneumoniae* and *Staphylococcus aureus* are 23.3 µg, 16.5 µg, 20.7 µg, and 25 µg, respectively. The higher antibacterial activity of the ethanolic extract of *M. pruriens* seeds due to the presence of active metabolites like flavonoids, alkaloids and steroids. 27, 28, 34.

Antioxidant activity

The antioxidant activity of ethanolic seed extract of *M. pruriens* as well as standard was examined for their scavenging DPPH, nitric oxide and hydroxyl (Figure 6, 7 and 8). The antioxidant scavenging activity against DPPH, nitric oxide and Hydroxyl is concentration dependent manner. The antioxidant activity of ethanolic seed extract is directly proportional to the concentration of the extract. The 50% of DPPH, nitric oxide and Hydroxyl radical scavenging activity was observed at 19.85, 22.45 and 56.75 µg/ml concentration of ethanolic seed extract. The free radical scavenging activity of ethanolic *Mucuna pruriens* seeds extract was increased while increasing the concentration of extract (Table 2).

Anti-inflammatory activity of ethanolic extract of *M. pruriens* seed

The inhibitory activity of ethanolic extract of *M. pruriens* seed, as well as standard, well known inhibitors of inflammation was determined (Table 3) by protein denaturation process. Inflammation is caused due to the denaturation of proteins. In this investigation, the ability of seed extract on the anti-inflammatory activity, extract inhibit the protein denaturation was evaluated. The inhibitory potential of the extract showed a concentration dependent. Maximum inhibition of 73% was observed at 300 µg/ml.

Proteinase enzyme plays an important role in the development of tissue damage during inflammations. Ethanolic seed extract was well known as proteinase inhibitor which exhibited significant proteinase inhibition activity at different concentrations (Table 3). It showed maximum inhibition of 64 % at 300 µg/ml. Furthermore, ethanol extract of seed demonstrated a markedly higher anti-inflammatory activity compared to the standard due to the presence of metabolites like phenol and esters compound.
Conclusion

The results of this present study demonstrated that the ethanol extracts of M. pruriens seeds possess antimicrobial, antioxidant and anti-inflammatory activities. GC-MS analysis revealed the presence of different active compounds involving in the microbial growth inhibition, antioxidant and anti-inflammatory properties. The extract serves as a free radical scavenger by inhibiting the DPPH, nitric oxide and hydroxyl. The inhibition of protein denaturation causing inflammation and proteinase activity was also studied. This study gives inspiration to identify the compound present in the M. pruriens seed responsible for antioxidant and anti-inflammatory that could be lead compound for designing a drug in the pharmaceutical applications.
