**Abstract:** The study was carried out to determine the *in vivo* antioxidant and lipid peroxidation effect of methanolic extract of whole plant of *Teramnus labialis* (L). High fat diet rats showed significantly ( $P < 0.001$ ) reduced the levels of tissues enzymatic antioxidant non enzymatic antioxidant and enhanced the level of TBARS. High fat diet induces the oxidative stress in cell by producing reactive oxygen species. Administration of methanolic extract of *Teramnus labialis* (L) in high fat diet rats were showed increased the levels of antioxidant Enzymes such as Superoxide dismutase (SOD), Catalase (CAT), Glutathione peroxidase (GPx), Glutathione reductase (GR) and enhanced the level of non enzymatic antioxidant Glutathione (GSH) when compared with HFD rats (Group II). The methanolic extract *Teramnus labialis* (L) in high fat diet rats were found lowered the concentration of TBARS when compared with HFD rats. Based on the results, we concluded that the methanolic extract of *Teramnus labialis* (L) is a significant source of natural antioxidant, which might be helpful in preventing the progress of various oxidative stresses.

**Key words:** High fat diet, *Teramnus labialis* (L), Antioxidant activity, rats.

## INTRODUCTION:

There is extensive evidence to implicate free radicals in the development of degenerative diseases<sup>1</sup>. It is suggested that free radical damage to cells leads to the pathological changes associated with aging<sup>2</sup>. Free radicals may also be a contributory factor in a progressive decline in the function of the immune system<sup>3</sup>. Recent reports indicate that there is an inverse relationship between the dietary intake of antioxidant-rich foods and the incidence of human diseases<sup>4</sup>. So, many researchers have focused on natural antioxidants and in the plant kingdom numerous crude extracts and pure natural compounds were previously reported to have antioxidant properties.

*Teramnus labialis* (L) spreng (Family; Fabaceae) is a herb, commonly known as mashaparni and a well known medicinal plant in the Ayurvedic system of medicine. It has been reported to be useful in treating rheumatism, tuberculosis, nerve disorders, paralysis and catarrhs<sup>5-7</sup>. and chemical analysis and nutritional assessment<sup>8</sup> the plant used as antihyperglycemic activity<sup>9</sup>, anti-inflammatory activities<sup>10</sup> a novel bioactive flavonol glycoside from *Teramnus labialis*<sup>11</sup>. Therefore, the present investigation focused to evaluate the *in vivo* antioxidant and lipid peroxidation effect of methanolic extract of whole plant of *Teramnus labialis*.

## **MATERIAL AND METHODS:**

### **1. Collection and identification of plant materials**

The Whole plant of *Teramnus labialis*, were collected from Kilikulam, Tirunelveli District of Tamil Nadu, India. Taxonomic identification was made from Botanical Survey of Medicinal Plants Unit Siddha, Government of India. Palayamkottai. The whole plant of *teramnus labialis* (Linn), were dried under shade, segregated, pulverized by a mechanical grinder and passed through a 40 mesh sieve.

### **2. Preparation of extracts**

The above powdered materials were successively extracted with methanol by hot continuous percolation method in Soxhlet apparatus<sup>12</sup> for 24 hrs. The extracts were concentrated by using a rotary evaporator and subjected to freeze drying in a lyophilizer till dry powder was obtained. The extracts were suspended in 2%. tween 80<sup>13</sup>.

### **3. Animals and treatment**

Male Wister rats of 16-19 weeks age, weighing 150-175g were procured from the Central Animal House, Rajah Muthiah Medical College, Annamalai university. The animals were kept in cages, 2 per cage, with 12:12 hr light and dark cycle at 25°±2°C. The animals were maintained on their respective diets and water *ad libitum*. Animal Ethical Committee's clearance was obtained for the study. Animals were divided into following 5 groups of 6 animals each:

- Group I (Control): Standard chow diet
- Group II : High Fat Diet (control)
- Group III :High fat diet+Methanol extract of *Teramnus labialis* (250mg/kg b.wt)
- Group IV : High fat diet+Methanol extract of *Teramnus labialis* (500mg/kg b.wt)
- Group V : High fat diet + standard drug atorvastatin (1.2 mg/kg b.wt)

#### **Animal diet**

The compositions of the two diets were as follows<sup>14</sup>:

**Control diet:** Wheat flour 22.5%, roasted bengal gram powder 60%, skimmed milk powder 5%, casein 4%, refined oil 4%, salt mixture with starch 4% and vitamin & choline mixture 0.5%.

**High fat diet:** Wheat flour 20.5%, roasted bengal gram 52.6%, skimmed milk powder 5%, casein 4%, refined oil 4%, coconut oil 9%, salt mixture with starch 4% and vitamin & choline mixture 0.5%, cholesterol 0.4%.

Rats of group III (dose 250mg)& IV(dose 500mg) were orally fed with the methanolic extract of *Teramnus labialis* and rats of group V were fed with standard drug atorvastatin. Both the methanolic extract *Teramnus labialis* and atorvastatin were suspended in 2% tween 80 separately and fed to the respective rats by oral intubation. At the end of 9 weeks all the animals were sacrificed by cervical decapitation after overnight fasting. Liver, heart and aorta were cleared of adhering fat, weighed accurately and used for the preparation of homogenate. Animals were given enough care as per the Animal Ethical Committee's recommendations. Portions of the tissues from liver, heart and aorta were blotted, weighed and homogenized with methanol (3 volumes). The lipid extract obtained by the method of Folch *et al*<sup>15</sup>. It was used for the estimation of thiobarbituric acid reactive substances<sup>16</sup> (TBARS). Another portion of the tissues was homogenized with phosphate buffer saline and used for the estimation of reduced Glutathione<sup>17</sup> (GSH), Superoxide dismutase<sup>18</sup> (SOD), Catalase<sup>19</sup> (CAT), and Glutathione peroxidase<sup>20</sup> (GPx), Glutathione reductase<sup>21</sup> (GR).

#### **Statistical analysis**

Results were expressed as mean ± SE of 6 rats in each group. One way analysis of variance (ANOVA) test was used to determine the statistical significance. Significance level was fixed at 0.05.

## **RESULTS AND DISCUSSION**

Table 1 illustrates the activities of tissues TBARS levels in HFD rats. TBARS levels were increased in liver, heart and aorta in group II rats were a clear manifestation of excessive formation of free radical and activation of lipid peroxidation. The significantly reduced the levels of TBARS, in rats administered with methanolic extract of *Teramnus labialis* along with HFD.

**Table 1: Effect of methanolic extract of *Teramnus labialis* on tissues TBARS and Glutathione (GSH) in rats fed HFD**

Groups	TBARS ( n mol MDA formed/g tissue)			GSH (mg/g tissue)		
	Liver	Heart	Aorta	Liver	Heart	Aorta
Groups I	24.82±0.67b*	42.22±0.21b*	18.22±0.13b*	4.32±0.12 b*	8.86±0.26b*	5.42±0.42b*

b group II compared with groups III, IV, V.

Glutathione, an endogenous antioxidant defense, is found in liver at high concentration. It plays a central role in the defense against free radicals, peroxides and a wide range of xenobiotics and carcinogens<sup>22</sup>. GSH also functions as free radical scavenger in the repair of radical caused biological damage<sup>23</sup>. Table 1 demonstrates the levels of Glutathione (GSH) in HFD rats. The significant fall in the levels of tissues Glutathione were observed in high fat diet rats (group II) as compared to the control rats (group I). Administration of methanolic extract of *Teramnus labialis* along with HFD rats substantially enhanced the levels of glutathione when compared with HFD rats (group II).

Table 2 shows that the effect of methanolic extract of *Teramnus labialis* on tissues SOD and

CAT enzyme levels in HFD rats. The activities of SOD and CAT in the tissue like liver, heart and aorta were significantly (P < 0.001) lowered in rats fed with high fat diet (group II) than control group animals. SOD plays an important role in the elimination of ROS and protects cells against the deleterious effects of super oxide anion derived from the peroxidative process in liver and kidney tissues High fat diet can cause the formation of toxic intermediates that can inhibit the activity of antioxidant enzymes<sup>24</sup> and the accumulation of O<sub>2</sub> - and H<sub>2</sub>O<sub>2</sub> which in turn forms hydroxyl radicals<sup>25</sup>. After administration of methanolic extract of *Teramnus labialis* along with HFD significantly increases the activities of SOD and CAT in tissues of rats when compared with high fat diet rats (group II).

**Table 2: Effect of methanolic extract of *Teramnus labialis* on tissue Superoxide dismutase (SOD) and Catalase (CAT) in rats fed HFD**

The activities of tissues glutathione peroxidase (GPx) and glutathione reductase (GR) in HFD rats were presented in Tables 3. Tissues glutathione peroxidase and reductase levels were significantly decreased in rats fed with HFD (group II) as compared to the control rats (group I). High fat diet decreased the ratio of oxidized glutathione reduced glutathione in tissue<sup>26</sup>. Administration of methanolic extract *Teramnus labialis* along with the HFD enhanced the levels of glutathione peroxidase and glutathione reductase in all the tissues as compared with HFD rats. A standard drug atorvastatin administered rats also showed elevated level of glutathione peroxidase and glutathione reductase.

### CONCLUSION

The results of the above study clearly demonstrated that the methanolic extract of *Teramnus labialis* had significant *in vivo* antioxidant and lipid peroxidation activity. These *in vivo* study indicate that this plant extracts is a significant source of natural antioxidant, which might be helpful in preventing the progress of various oxidative stresses. Therefore, further investigations need to be carried out to isolate and identify the antioxidant compounds present in the plant extract.
