# Parents psychological Burden of Care for Children with Mental Retardation in The Middle Euphrates Governorates 

Alwan Hassan*,Saja H. Mohammed<br>Babylon University, College of nursing,Hilla, Iraq

#### Abstract

The responsibility of caring for mentally retarded child can contribute to parent's burden. The study shows that parents of children with mental retardation experience high level of burden. Objective: The present study aims to assess the level of psychological burden of care among parents who have children with mental retardation and to identify the relationship between parents burden of care for children with mental retardation and their sociodemographic data such as age, sex etc. Methodology: A descriptive -analytical study design was conducted on22th January 2016 to 25 th march 2016. A purposive (non-probability) sample of (90) parents (mother or father) were selected throughout the use of non- probability sampling approach, that include parents who have children with mental retardation attending mental disability care institute. The questionnaire items were constructed by the researcher for the purpose of present study. In order to test the validity of the questionnaires, the instrument was presented to panel of experts in different fields to make it more valid. Data have been analyzed by using descriptive and inferential statistics. Results: The results of the study showshigh psychological burdens due to the handicap children. There is a significant relationship between the levels of parents' burdens and their child hand cap degree and the monthly income As for the psychological status present a significant differences between the psychological burden and the parents level of education and residency. but there are statistical non significances between the parents burden with other parents demographical data. Conclusion: The study concluded that there is high level ofparentspsychological burden due to the presence of mental retardation child in the family. The level of mental retardation is very important indication about the level of the burden. Recommendations: The study is recommended that future researches should be directed towards exploring psychological intervention factors which help to minimize the burden on parents of children with mental retardation.

Keywords : mental retardation, burden, children.

## Introduction

Mental retardation (MR) is a general neurodevelopmental disorder seen as meaningfully reduced intellectual and adaptive effective. It is called intellectual developmental impairment (IDI), general learning impairment, or Intellectual disability (ID) ${ }^{1}$.

It is characterized by a total IQ below 70 , in adding to deficits in 2 or more adaptable activities that disturb every day general activities. The description now consists of two factors, one concerning mental operational aspect and the second related to persons' functional skills in their surroundings ${ }^{2}$.

Intellectual disability influences about $3-4 \%$ of the overall human population. $76-91 \%$ of the afflicted persons have mild mental incapacity. Non-syndromic or idiopathic conditions account for $31-51 \%$ of conditions. Nearly a quarter of cases are produced via an anatomical illness ${ }^{3}$.

Whenever the diagnosis of MR is done, the parents have to make great changes in their desires and expectations for the child. They often experience prolonged depression, guilt, pity or anger, and lack of ability to deal with substantial practical and financial problems. Few of them reject their children, while others become over involved in their health care, sacrificing other important aspects of family life ${ }^{4}$.

Legal responsibility associated with bearing such mentally handicapped children usually influences whole atmosphere of home including regular family life, emotional aspects and financial resources of family. The high level of care needed by a child with mental retardation may become taxing and may even affect both physical and psychological health of caregivers ${ }^{5}$.

With regards to the mothers of children with mental disabilities, they face indifferent behavior and noncooperation in looking after their children due to not being able to follow up their career and they also experienced marital problems ${ }^{6}$.

It has also been reported that there is an interaction between the child with mental retardation and the family; this interaction may lead to negative dynamics and cause stress and reactions to the child with disabilities ${ }^{7}$.

Also there are other parameters including the socio-economic deprivation of the parents and the pattern the parents care for their children and this may also contribute in elevation of their stress levels ${ }^{8}$.

## Objectives of the Study

1. To assess the level of burden of care among parents who have children with mental retardation.
2. To identify the relationship between parents burden of care for children with mental retardation and their sociodemographic data such as age, sex etc.

## Methodology

A descriptive -analytical study used the assessment approach to assess the Parents Burden of Care for Children with Mental Retardation in The Middle Euphrates Governorate. This design was carried out inorder to achieve the objectives of the present study

A questionnaire was constructed by the researcher.
The questionnaire items based on: Extensive review of related studies and literature.
Scales such as: General health questionnaire, the parental stress scale.
The questionnaire consist of Psychological burden: This domain consisted ( 51 items) it was consisted of (3) subdomains which included:
a. Anxiety: it consisted of (17) items.
b. Stress: it consisted of (16) items.
c. Depression it consisted of (18) items.

In order to test the validity of the questionnaires, the instrument was presented to panel of experts in different fields to make it more valid.

The data collection was carried out from February 24th 2016 to April 3rd 2016. The questionnaire has been administrated personally by the researcher to parents of mental retardation child. Data were analyzed through the application of descriptive statistical analysis (Frequency F., Percentage P.) and inferential data analysis plan (Chi-square) with (SPSS, Version 20).

## Results

Table (1)Distribution of the study sample by theirDemographic Data

| Demographic Data | Rating And Intervals | Mother |  | Father |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | F | \% | F | \% |
| parents age | 20-29 | 3 | 7.5 | 2 | 4 |
|  | 30-39 | 15 | 37.5 | 11 | 22 |
|  | 40-49 | 16 | 40 | 20 | 40 |
|  | 50-59 | 6 | 15 | 12 | 24 |
|  | 60+ | 0 | 0 | 5 | 10 |
|  | Total | 40 | 100 | 50 | 100 |
| parents Levels Of education | Illiterate | 8 | 20 | 2 | 4 |
|  | Read And Write | 6 | 15 | 11 | 22 |
|  | Primary School Graduated | 11 | 27.5 | 20 | 40 |
|  | Secondary School Graduated | 7 | 17.5 | 12 | 24 |
|  | College Or Institute Graduated | 8 | 20 | 5 | 10 |
|  | Total | 40 | 100 | 50 | 100 |
| parents Occupation | government employee | 6 | 15 | 13 | 26 |
|  | Private job |  | 5 | 5 | 10 |
|  | free business |  | 2.5 | 18 | 36 |
|  | Retired | 1 | 2.5 | 13 | 26 |
|  | Unemployed/House wife | 30 | 75 | 1 | 2 |
|  | total | 40 | 100 | 50 | 100 |

This table shows the study results indicate that the majority of both mother and father are at age group (40-49) years old ( $40 \%$ ). In addition, the study results indicate that both mothers and fathers are primary school graduated ( $27.5 \%$ ) and ( $40 \%$ ) respectively, ( $75 \%$ ) of mothers are house wife, ( $36 \%$ ) of fathers' occupation is free business.

Table (2) distribution of the study sample by their general information

| $\begin{gathered} \text { General } \\ \text { information } \end{gathered}$ | rating | frequency | percentage | cumulative percent |
| :---: | :---: | :---: | :---: | :---: |
| Social Status Of Parents | Live Together | 82 | 91.1 | 91.1 |
|  | Divorced | 3 | 3.3 | 94.4 |
|  | Separated | 5 | 5.6 | 100 |
| Who Is Provide Child Care | Mother | 82 | 91.1 | 91.1 |
|  | Father | 8 | 8.9 | 100 |
| Monthly Income | Sufficient | 20 | 22.2 | 22.2 |
|  | Sufficient To Some Extent | 33 | 36.7 | 58.9 |
|  | Insufficient | 37 | 41.1 | 100 |
| Residency | Rural | 4 | 4.4 | 4.4 |
|  | Countryside | 15 | 16.7 | 21.1 |
|  | Urban | 71 | 78.9 | 100 |
| Family Member | 1-3 | 7 | 7.8 | 7.8 |
|  | 4-6 | 49 | 54.4 | 62.2 |
|  | 7-9 | 27 | 30 | 92.2 |
|  | 10 and more | 7 | 7.8 | 100 |
| Number Of Handicapped Child | 1 | 74 | 82.2 | 82.2 |
|  | 2 | 12 | 13.3 | 95.6 |
|  | 3 | 4 | 4.4 | 100 |

This table shows that $(91.1 \%)$ of parents are living together, $(91.1 \%)$ of children are caring by the mothers, $(78.9 \%)$ of the study subjects are urban residents, ( $54.4 \%$ ) of families have $4-6$ family members, and $(82.2 \%)$ of families have one handicapped child.

Table (3) Childs' demographic Data

| demographic data | Frequency | Percent | Cumulative Percent |
| :---: | :---: | :---: | :---: |
| gender |  |  |  |
| Male | 56 | 62.2 | 62.2 |
| Female | 34 | 37.8 | 100 |
| Child age |  |  |  |
| <= 10 | 23 | 25.6 | 25.6 |
| 11-13 | 38 | 42.2 | 67.8 |
| 14+ | 29 | 32.2 | 100 |
| Age at diagnosis |  |  |  |
| <=3 | 67 | 74.4 | 74.4 |
| 4-7 | 18 | 20 | 94.4 |
| 8+ | 5 | 5.6 | 100 |
| Handicap degree |  |  |  |
| 1 | 22 | 24.4 | 24.4 |
| 2 | 48 | 53.3 | 77.8 |
| 3 | 14 | 15.6 | 93.3 |
| 4 | 6 | 6.7 | 100 |
| Number of brothers |  |  |  |
| No brothers | 9 | 10 | 10 |
| 1-3 | 74 | 82.2 | 92.2 |
| 4 and more | 7 | 7.8 | 100 |
| Number of sister |  |  |  |
| No sisters | 18 | 20 | 20 |
| 1-3 | 58 | 64.4 | 84.4 |
| 4 and more | 14 | 15.6 | 100 |
| Child series |  |  |  |
| 1-3 | 61 | 67.7 | 67.7 |
| 4 and more | 29 | 32.3 | 100 |

This table shows that (53.3\%) of the handicapped child are within the moderate degree of handicap, $(42.2 \%)$ of the children are within the second age group (11-13) years old, $(62.2 \%)$ of the children are males, $(82.2 \%)$ of the children have 1-3 brothers, $(64.4 \%)$ of the children have $1-3$ sisters, $(67.7 \%)$ of the children series is $1-3$, and $(74.4 \%)$ of the children age at diagnosis is 3 years or less.

Table (4) level of psychological burdens

| psychological <br> burdens | Levels | Frequency | Percent | Cumulative <br> Percent |
| :---: | :---: | :---: | :---: | :---: |
| psychological <br> burdens | Low | $\mathbf{1 2}$ | $\mathbf{1 3 . 3}$ | $\mathbf{1 3 . 3}$ |
|  | Moderate | $\mathbf{4 3}$ | $\mathbf{4 7 . 8}$ | $\mathbf{6 1 . 1}$ |
|  | High | $\mathbf{3 5}$ | $\mathbf{3 8 . 9}$ | $\mathbf{1 0 0}$ |

This table shows that (47.8\%) of the parents are exhibit moderate psychological burden, (38.9\%) exhibit a high psychological burdens, and (13.3\%)exhibit low psychological burden,

Table (5) relationship between parents' burdens/psychological and their demographic data

| Demographic data | Rating | psychological |  |  | Chi. sq | d.f | p. value |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Social parents | Live Together | 11 | 40 | 31 | 3.796a | 4 | 0.434 |
|  | Divorced | 1 | 0 | 2 |  |  |  |
|  | Separated | 0 | 3 | 2 |  |  |  |
| Residency | Rural | 1 | 1 | 2 | 5.385a | 4 | 0.025 |
|  | Countryside | 1 | 11 | 3 |  |  |  |
|  | Urban | 10 | 31 | 30 |  |  |  |
| Family members | 1-3 | 2 | 2 | 3 | 9.613a | 8 | 0.293 |
|  | 4-6 | 5 | 23 | 21 |  |  |  |
|  | 7-9 | 3 | 15 | 9 |  |  |  |
|  | 10-12 | 1 | 3 | 2 |  |  |  |
|  | 13+ | 1 | 0 | 0 |  |  |  |

This table shows that there is a non-significant relationship between the levels of parents' psychological burdens and their demographic data at $p$-value more than 0.05 .except parent's level of education and residency show significant relationship.

## Discussion

The result of the study indicate that $40 \%$ of parents are at age group (40-49) years old. This result agree with the findings of (El-Ganzory, et al., 2013) they found that (42\%) of the participants' ranged from 40 to more than 50 years old ${ }^{9}$. Also agree with (Ntswane andRhyn 2007) who found that the majority of of both mother and father $(50 \%)$ are at age group $(41-50)$ years old ${ }^{10}$.

According to levels of education the result showsthat both mothers and fathers are primary school graduated $(27.5 \%)$ and $(40 \%)$ respectively. This result agree with the findings of (Motamedi, et al., 2007) they found that $(28 \%)$ of mothers are read and write and primary school ${ }^{11}$. Also the result agree with the findings of (Singh,. et al., 2014) they found that( $44 \%$ ) are less than secondary educational level ${ }^{12}$.

The result shows that the majority ( $75 \%$ ) of mothers is housewives, ( $36 \%$ ) of fathers' occupation are free business. This result agrees with the findings of (Kerenhappachu\&Sridevi 2014) they found that the mothers of children with mental retardation $93.3 \%$ are housewives ${ }^{13}$. This result also agrees with the findings of (Motamedi, et al., 2007) they found that $88 \%$ of the mothers are housewives ${ }^{11}$.

According to the Social Statusof parentsthe result shows that the majority of parents living together $(91.1 \%)$. This result agree with the findings of (El-Ganzory, et al., 2013) Who found that (50\%) were married ${ }^{9}$. This result agree with the findings of (Hussein 2015)who found that More than $50 \%$ of both parents in the study reported that no change has happened in their marital life ${ }^{15}$.

According to who is provide care the result shows that $91 \%$ were mothers while ( $8.9 \%$ ) fathers provided child care. These results agree with the findings of (Shanthi, et al., 2015)who found that in their study $83.3 \%$ of primary care givers were females ${ }^{15}$.This result agrees with the findings of (Hussein 2015) who found that the responsibility of caring for the mentally retarded child is taken by the mothers ${ }^{14}$.

According to the monthly incomethe majority of the parents (41.1\%)have insufficient income. This result agree with the findings of (Maheswari 2014) who found that half of the respondents are poor and they do not have other sources of income other than their monthly income to take care of their special children with special needs and borrowed money to meet out the household ${ }^{16}$.

According to residency of the parents the result shows that the majority of parents (78.9\%) of the study subjects are urban residents.This result agree with the findings of (Kerenhappachu\&Sridevi 2014) In the group of mothers of children with mental retardation $93.3 \%$ belongs to urban area background ${ }^{13}$. This result agree with the findings of (Chouhan et al., 2016) the mothers of children with mental retardation (63.3\%) belongs to urban area background.expenses and treatments ${ }^{17}$.

According to number of family members the result shows that (54.4\%) of families have 4-6 family members. This result agree with (Parish, et al,.2004) who found that the family members from 3-6 members ${ }^{18}$. While this result agrees with the findings of (Lakhani, et al., 2007)who found that the (32\%) had 4 members, ( $35 \%$ ) had 5 family members ${ }^{19}$.

Our result show ( $82.2 \%$ ) of families has one handicapped child. This result agree with the finding of (Hussein 2015) who found that maximum of the families (above $86 \%$ ) had one mentally retarded kids ${ }^{(14)}$.

Our result shows ( $62.2 \%$ ) of the children are males. This result agree with the result of (Gupta, et al., 2012) who found that $71.2 \%$ of sample are males ${ }^{(20)}$.. This result agree with the findings of the (Azeem et al., 2014) they found that The sample were $30 \%$ females and $70 \%$ males ${ }^{21}$.

Our result shows ( $42.2 \%$ ) of the children are within the second age group (11-13) years old.This result agree with the result of (Malhotra and Sharma2013) they found Majority of children belongs to 9-12 years age group $(30 \%)^{(22)}$.. This result agree with the findings of the (Azeem et al., 2014) they found that The mean age of the children was 10.5 years ${ }^{21}$.

Our result show ( $74.4 \%$ ) of the children age at diagnosis is 3 years or less. This result agree with the result of (Maheswari2014 ) he found that majority of their children ( $56 \%$ ) have the disability diagnosis from early years after birth ${ }^{16}$. These results agree with the findings of the (Azeem et al., 2014) they found that $82 \%$ of the children had ID diagnosis since birth ${ }^{21}$.

Our result show ( $53.3 \%$ ) of the handicapped child are have moderate degree of handicap. this result agree with the finding of (Lakhani, et al., 2007) who found that ( $54 \%$ ) children had mild-to-moderate mental retardation ${ }^{19}$. This result agree with the findings of the (Azeem et al., 2014) they found that $42 \%$ moderate $\mathrm{ID}^{21}$.

The result also shows that ( $82.2 \%$ ) of the children have 1-3 sibling.This result agree with (Hakeem and Subathra 2013) they found that ( $40 \%$ ) respondents has 3 sibling ${ }^{23}$.

The study revealed that psychological burden of parents were( $47.8 \%$ ) moderate burdens, ( $38.9 \%$ ) high burden and ( $13.3 \%$ ) low burden due to the handicap among their children. This result agree with the findings of (Upadhyaya and Havalappanavar2008) who found parentshave moderate psychological burden $(43 \%)^{24}$.

The result shows that no significant relation between age of mother and her burden. This result is supported by the findings of (Jadhav 2013) who found no significant relation between burden and age of the parents or caregivers ${ }^{25}$.

The result shows that there is no significant relationship betweenage of father and his burden. This results supported by the findings of (Jadhav 2013) who found there was no significant relation was found with burden score and age of the parents or caregivers ${ }^{25}$.

Concerning the mother level of education result shows that there is a significant relationship between psychological parent's burden and mother level of education at p value ( 0.0125 ). This result corroborate with some others at the same time, such as a study that states depression is high among illiterate parents (Sepehrmanesh, 2003, and Ramazani, 2001) ${ }^{11}$.This result disagree with those findings of (Sethi, et al., 2007)who found that Parents' education status of the family didn't mark any difference to theapparent burden and stress ${ }^{26}$.

Also about education level of the father the result shows that there is a significant relationship between psychological parents burden and father level of education at p value (0.012). This result corroborate with some others at the same time, such as a study that states depression is high among illiterate parents (Sepehrmanesh, 2003, and Ramazani, 2001) ${ }^{11}$. This result are different from those findings of (Sethi, et al., 2007)who found that Parents' education status of the family didn't mark any difference to the apparent burden and stress ${ }^{26}$.

The result also shows that there is a non-significant relationship between mother occupation and her psychologicalburden. This results supported by the findings of (Jadhav 2013) who found there was no significant co-relation was found with burden score and of the occupation of the parents or caregivers ${ }^{25}$.

There is a non-significant relationship between father occupation and his psychologicalburden. These results agree with the findings of (Jadhav 2013) she found there was no significant co-relation was found with burden score and of the occupation of the parents or caregivers ${ }^{25}$.

There is a non-significant relationship between social status of parents and psychologicalburden. These findings supported by with the finding of (Maheswari 2014)who found that there were no significant associations between the marital status and care giving burden of the respondents ${ }^{16}$.

There is a non-significant relationship between parent'spsychologicalburden and the person who is Provide Child Care at p value ( 0.882 ). That's maybe due to the father or mother give the same care for them child and the main sample (father and mother ) are living together .

There is a significant relationship between parents psychologicalburdenandMonthly income at $p$ value (0.027). These findings supported by the finding of (Maheswari 2014) who found that a significant association between the respondents' income and burden of care giving ${ }^{16}$.

There is significant relationship between psychological parents' burden and residency. This result disagree with (Motamedi, et al., 2007) who found that there were no significant relationship between the depression levels of the mothers with their family's housing area ${ }^{11}$.

There is non-significant relationship between family members and psychologicalburden. These findings are supported by the finding of (Maheswari 2014) who found that there were no significant associations between the family members and care giving burden of the respondents ${ }^{(16)}$.

## Conclusion

All parents are affected by the presence of mentally retardate children in different levels.the prevalence of burden for both mother and father are at age group (40-49) years old.There are non-significant differences between parents burden and child gender.most mental retardation children have significant relation between parents burden and mental retardation degree .

## Recommendations

1. Educate the parents about the psychological effects and it's negatively impacts on their lives to face all kinds of difficult conditions in which they live from the children.
2. The study is recommended that future researches should be directed towards exploring psychological intervention factors which help to minimize the burden on parents of children with mental retardation.
3. Constructing a special program for children performing at home and in the institute in cooperation with parents
4. Establishing special institute for MR children to providing special services ton decrease parents burden.
5. Group psychotherapy education program for MR parents to increase their knowledge and experience about behavioral modification, coping strategies and stress management skill to improve their psychological wellbeing and decrease distress.
