Abstract:Three water samples were collected from vennaimalai study area. These samples are subjected for analyzing water parameters in Karur water testing laboratory. Nearly 24 water parameters were analysed. This analysis includes 18 chemical water parameters and 6 physical water parameters. This analysis revealed that there were considerable variations in the samples with respect to chemical characteristics. A comparison of physico-chemical characteristics of ground water samples and dye effluent samples has also been made with WHO (1984) and BIS 1998 standards.
