Abstract : An optimal load-flow solution gives the optimal active and reactive power dispatch for a static power system loading condition. Computationally, it is a very demanding nonlinear programming problem, due to the large number of variables and in particular to the much larger number of variables and in particular to the much larger number and types of limit constraints which define the boundaries of technical feasibility This paper solves the standard 26 bus power system network.

Keywords : optimal power flow; OPF; Lamda iteration
