Abstract : “Covid-19 (coronavirus disease 2019) is a global public health crisis.” There is no successful accepted prescription until recently, but researchers are rushing to find a cure for patients, particularly those who have other underlying disorders or develop a severe form of the disease. The purpose of this study is to establish the facts regarding COVID-19 as much as it is a practical treatment. In this study, we talk about some of the drugs that were used to treat patients infected with the Coronavirus. Some of these drugs had effective results in reducing serious symptoms, such as dexamethasone, and some of them were banned after several trials.

Keywords : Covid-19, Treatment, Drugs, coronavirus, Dexamethasone.
